

CLASSES DIAGRAMS

Describes the classes in our applications

VIEW AN EVENT

For our project, these are the classes that we have envisioned for now.

- The visitor class inherits from the User class.
- If a user object is destroyed, all the events related to that user also get destroyed (Composition hierarchy). On the other hand if an event is destroyed, the user still stays active (Aggregation hierarchy).
- If an event is destroyed, the interface for Kanban View and Calendar view stays active.

If we decide to work on Filtration, we would probably need more classes like Course etc.
